                                                                                                                                                                       promoter linked to tet operon, and vectors and cells where gen expression is regulated by tetracycline Disclosure; Fig 9A-C; 37pp; English.

CDNA coding for the rabbit progesterone receptor was placed un control of the PhCMV*-1 promoter (see T0689), resulting in tetracycline-regulated expression vector pUHDpgr-3 contg. the sequence given in T06872. The construct was transfected into eukaryotic cells expressing the tTA transactivator (T06867) to allow tetracycline-regulated expression of the receptor.

The minimal promoter PhCMV*-1 is based on the human CMV intermediate-early promoter (with enhancer region removed), fused to a tetracycline operator, teto. The promoter is used to express tTA transactivator in host cells. In clone pulb BGR3 (given in Q76269), CDNA for rabbit progesterone receptor is under the control of PhCMV*-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Bujard H, Gossen M;

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Mon Nov 2 16:27:57 1998; MasPar time 27.56 Seconds 702.514 Million cell updates/sec

Tabular output not generated.

Title:

Description: Perfect Score:

>US-08-906-365-2 (1-530) from US08906365.pep 3904 1 MDIKNSPSSLNSPSSYNCSQ......ECSPAEDSKSKEGSQNPQSQ 530

Scoring table: PAM 150 Gap 11

Searched: 120441 segs, 36531193 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database:

pir56 1:pir1 2:pir2 3:pir3 4:pir4 5:nrl3d

Statistics: Mean 48.751; Variance 99.595; scale 0.489

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.

TION #superfamily estrogen receptor; erbA transforming protein

NT The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

**YT In the absence of ligand, steroid hormone receptors are thought be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor appears to recognize discrete DNA sequences upstream of transcriptional start sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          506

##note sequence extracted from NCBI backbone (NCBIN:106597)

WIT The steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular proliferation and differentiation in target tissues.

WIT In the absence of ligand, steroid hormone receptors are thought be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor compappears to recognize discrete DNA sequences upstream of

n the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proliferation and differentiation in target tissues.

In the absence of ligand, steroid hormone receptors are thought to be weakly associated with nuclear components; hormone binding greatly increases receptor affinity. The hormone-receptor complex appears to recognize discrete DNA sequences upstream of transcriptional start sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                me steroid hormones and their receptors are involved in the regulation of eukaryotic gene expression and affect cellular

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
